

one hyper-leg: tiles@Shenzhen ⊗ carriage ⊗
storage ⊗ carriage ⊆ tiles@door, Tue 9–12

Nobody hands tiles to anybody as a market leg: the factory sells tiles where they are, the carriers sell carriage, the warehouse sells storage, each unconditional. The buyer's one want is composed from all four, so it clears with all or none. The buyer pays once; clearing splits the euro give at the per-leg prices, twice through exchanges. Every node nets to zero on its own scale. Not a loop: a circulation with a hub, on a hypergraph.
